Technical People for client systems development

Client Requirement

C++ developer with 3–5 years of experience in polymorphism (object orientation).

Taplow Solution

- Modern C++ V20 is used along with various design patterns such as Bridge, Abstract, Factory, Singleton, Observer, Visitor, and Injection techniques.

- Other keywords: Linux, CMake, git, MS Visual Code or CLion, Google Protocol Buffers & WxWidgets.

- Knowledge of LUA, cross-platform development, ARM, Jenkins, and MS Visual Studio is a plus.

- Since the context is image processing, familiarity with the field—and potentially TensorFlow Lite—is beneficial but by no means required.

The role had primarily involved being the C++ expert in a team of skilled image processing specialists who are not necessarily proficient in C++.

Candidates needed to be able to work very independently, and think in terms of platforms that provide accessible interfaces for image processing.

Outcome

Candidates provided within 7 days and chosen candidates started immediately for a period of several months.
